	MEETING NOTES		

Project Name	:	ALAS – AI-Based Smart Glasses
Meeting No	:	6
Date	:	28.02.2026 Friday Time : 16.00-16.30
Organizer	:	Place : Online HAVELSAN
Participants	:	Yasin YILDIRIM, Mehmet ALGUL, Ilayda YAKAR, Enes UNLU

1. AGENDA

1. Evaluation of high-volume dataset management and alternative cloud storage options
2. Optimization of real-time object detection and FPS performance on edge devices
3. Investigation of student-specific cloud benefits (AWS Educate, etc.) and alternative AI architectures
4. Data versioning and synchronization strategies for teamwork collaboration

2. POINTS DISCUSSED

- Uploading high-volume datasets directly to general cloud services causes synchronization problems.
- HAVELSAN mentors suggested researching Amazon S3 Buckets for scalable and structured storage of visual data as a future alternative.
- It was noted that cloud services (such as AWS) offer additional benefits and free premium tiers for students with ".edu" email addresses; these opportunities should be investigated.
- The implementation of Data Version Control (DVC) was suggested to manage dataset iterations.
- The challenge of maintaining high FPS for real-time obstacle detection was discussed.
- For the core object recognition task, **YOLOv8** (initial training) will be the primary focus. Following the performance results of the initial YOLOv8 training, alternative CNN architectures such as **SSD MobileNet** may be tested as efficient options for embedded systems.
- A gradual testing approach was recommended to identify hardware/software bottlenecks on the **Jetson Nano** platform.
- The end-to-end operational flow remains focused on capturing camera feed, processing obstacles, and providing voice-guided navigation for the visually impaired.

3. DECISIONS

- **Cloud & Storage Research:** The team will evaluate Amazon S3 and student-specific cloud benefits for future use, alongside DVC for version tracking.

- **Model Strategy:** Initial efforts will focus on YOLOv8 training. SSD MobileNet and other CNN alternatives will be considered based on performance benchmarks.
- **Optimization Strategy:** FPS performance will be monitored through a step-by-step testing methodology.

4. ACTIONS

No	Topic	Explanation	Responsible	Planned date	Status*
01	**Cloud & Benefits Research**	Investigate Amazon S3 and free premium student benefits (via .edu emails)	All team members		O
02	**Versioning**	Initialize DVC (Data Version Control) for the project repository	All team members		O
03	**YOLOv8 Training**	Conduct initial training and FPS tests; benchmark for potential SSD MobileNet transition	All team members		O
04	**Documentation**	Update the System Architecture with the new cloud research and model roadmap	All team members		O

**** O: Open, C: Closed, D: Cancelled***
